image-classification

April 22, 2023

Sanjana Jadhav (CS 4375.004)

1 Image Classification using Deep Learning

In this notebook, we will try to classify cards using the following three models: Sequential Model, Convolutional Neural Networks Model, & Pre-Trained (Transfer Learning) Model

Dataset: https://www.kaggle.com/datasets/gpiosenka/cards-image-datasetclassification (this dataset was already split into train and test)

Other Sources: Slides, Textbook, Professor Mazidi's Github + other sources listed below

1.0.1 Data Processing + Visualization

import numpy, pandas, & tensorflow

- numpy: numerical computing library
- pandas: data analysis library
- tensorflow: used to build/train neural network models

[2]:
```
import numpy as np
import pandas as pd
import tensorflow as tf
import matplotlib.pyplot as plt
```

import train/test data

- use tf to import train/test data
- source: https://www.tensorflow.org/api_docs/python/tf/keras/utils/image_dataset_from_directory
- important parameters: image size (224 x 224), seed=1234 (for reproducibility), batch size is 32

[4]:
```
train = tf.keras.preprocessing.image_dataset_from_directory(
    "/kaggle/input/cards-image-datasetclassification/train",
    labels="inferred",
    label_mode="categorical",
    color_mode="rgb",
```

```
    image_size=(224, 224),
    seed=1234,
    batch_size=32,
)

test = tf.keras.preprocessing.image_dataset_from_directory(
    "/kaggle/input/cards-image-datasetclassification/test",
    labels="inferred",
    label_mode="categorical",
    color_mode="rgb",
    image_size=(224, 224),
    seed=1234,
    batch_size=32,
)
```

```
Found 7624 files belonging to 53 classes.
Found 265 files belonging to 53 classes.
```

1.0.2 Print/Plot Class Distribution

Sources Used:

- https://matplotlib.org/stable/api/_as_gen/matplotlib.pyplot.figure.html
- https://matplotlib.org/stable/api/_as_gen/matplotlib.pyplot.xticks.html

[33]:
```
print(train.class_names)

# set number of classes
num_classes = len(train.class_names)
```

```
['ace of clubs', 'ace of diamonds', 'ace of hearts', 'ace of spades', 'eight of
clubs', 'eight of diamonds', 'eight of hearts', 'eight of spades', 'five of
clubs', 'five of diamonds', 'five of hearts', 'five of spades', 'four of clubs',
'four of diamonds', 'four of hearts', 'four of spades', 'jack of clubs', 'jack
of diamonds', 'jack of hearts', 'jack of spades', 'joker', 'king of clubs',
'king of diamonds', 'king of hearts', 'king of spades', 'nine of clubs', 'nine
of diamonds', 'nine of hearts', 'nine of spades', 'queen of clubs', 'queen of
diamonds', 'queen of hearts', 'queen of spades', 'seven of clubs', 'seven of
diamonds', 'seven of hearts', 'seven of spades', 'six of clubs', 'six of
diamonds', 'six of hearts', 'six of spades', 'ten of clubs', 'ten of diamonds',
'ten of hearts', 'ten of spades', 'three of clubs', 'three of diamonds', 'three
of hearts', 'three of spades', 'two of clubs', 'two of diamonds', 'two of
hearts', 'two of spades']
```

[5]:
```
import os

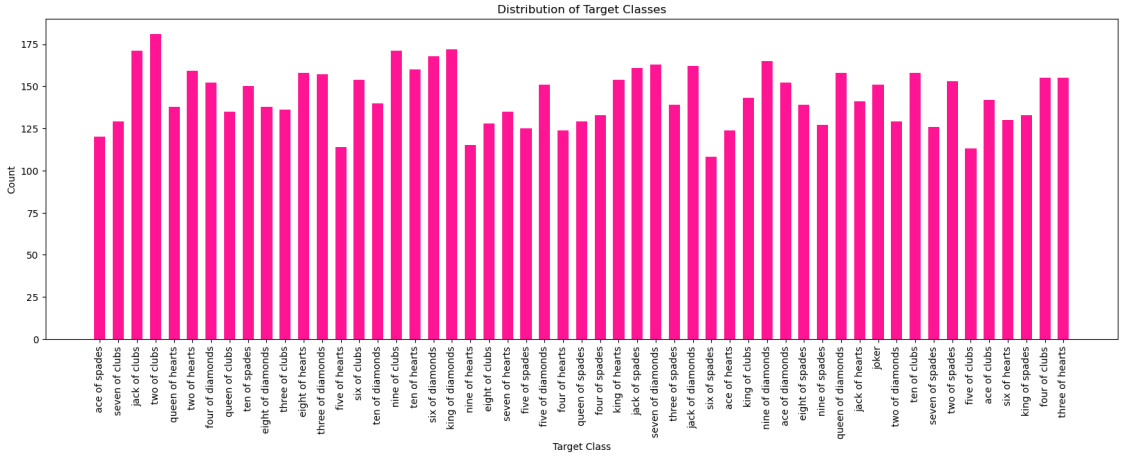
# Get the class names and indices
class_names = os.listdir("/kaggle/input/cards-image-datasetclassification/
 ↪train")
class_indices = dict(zip(class_names, range(len(class_names))))

# Get class counts
class_counts = np.zeros(len(class_names))
for images, labels in train:
    class_counts += np.sum(labels.numpy(), axis=0)

# Increase size of graph for readibility
plt.figure(figsize=(20, 6))

# Create a bar graph
plt.bar(class_names, class_counts, width=0.6, align='center', color='deeppink')
plt.title('Distribution of Target Classes')
plt.xlabel('Target Class')
plt.ylabel('Count')
plt.xticks(rotation=90)

# Print graph
plt.show()
```



1.0.3 Plot Sample Images from Training Data

Source Used:

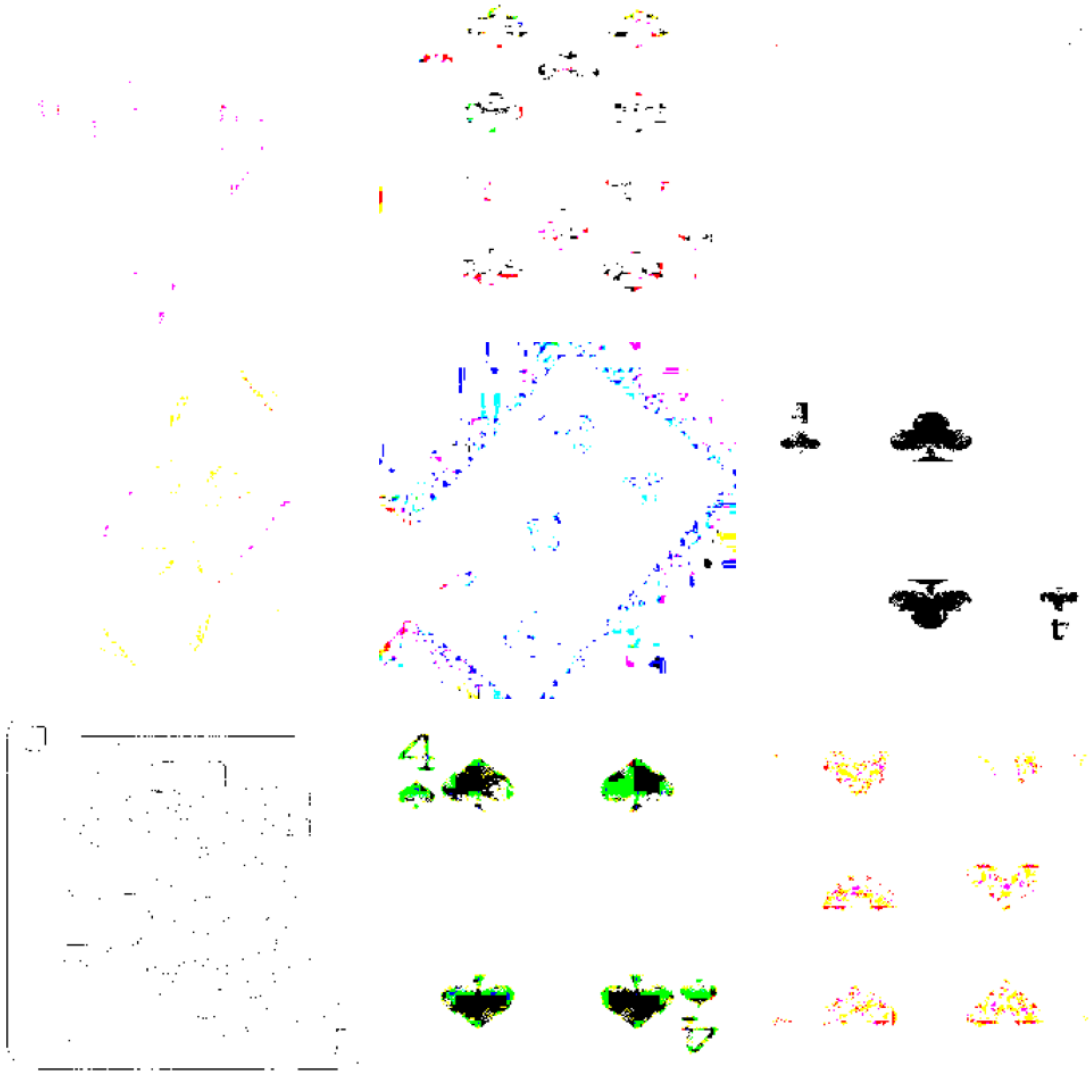
- https://github.com/kjmazidi/Intro-to-Deep-Learning/blob/main/Part%202%20Deep%20Learning%20with%
  Cats%20and%20dogs%20classification.ipynb

- As we can see, it is hard to see the images.

[27]:
```
def plotImages(images_arr):
    fig, axes = plt.subplots(3, 3, figsize=(10,10))
    axes = axes.flatten()
    for img, ax in zip(images_arr, axes):
        ax.imshow(img)
        ax.axis('off')
    plt.tight_layout()
    plt.show()

# Get a batch of images and labels from the dataset
images, labels = next(iter(train))
image_batch = images.numpy()

# Plot the images in a 3x3 grid
plotImages(image_batch[:9])
```



1.0.4 Sequential Model

- input layer: image size is 224 x 224 and channels = 3
- rescale the image between [0,1]
- flattens tensor into 1d array
- create a dense layer with 256 neurons and relu activation
- drop (0.5) to prevent overfitting
- create another dense layer with 128 neurons and relu activation
- drop (0.5) to prevent overfitting
- create another a dense layer with 53 neurons (num_classes) and softmax activation (used for multi-class classification to output probabilities)

[34]:
```
model = tf.keras.Sequential([
    tf.keras.layers.InputLayer(input_shape=(224, 224, 3)),
    tf.keras.layers.Rescaling(1./255),
    tf.keras.layers.Flatten(),
    tf.keras.layers.Dense(256, activation='relu'),
    tf.keras.layers.Dropout(0.5),
    tf.keras.layers.Dense(128, activation='relu'),
    tf.keras.layers.Dropout(0.5),
    tf.keras.layers.Dense(num_classes, activation='softmax')
])
```

Compile/Train Model

[35]:
```
# Compile Model
# Loss: categorical_crossentropy (used for multi-class classification for␣
 ↪labels that must fit in one class)
# Optimizer: rmsprop
# Metrics: Accuracy
model.compile(loss='categorical_crossentropy',
              optimizer='rmsprop',
              metrics=['accuracy'])

# Train model
# Train model using the training data, 10 epochs, a batch size of 32, and use␣
 ↪the test data
history = model.fit(train,
                    epochs=10,
                    batch_size=32,
                    validation_data=test)
```

```
Epoch 1/10

 ↪001.jpg'
img = load_img(img_path, target_size=(224, 224))
img_arr = img_to_array(img) / 255.0
img_arr = img_arr.reshape((1, 224, 224, 3))

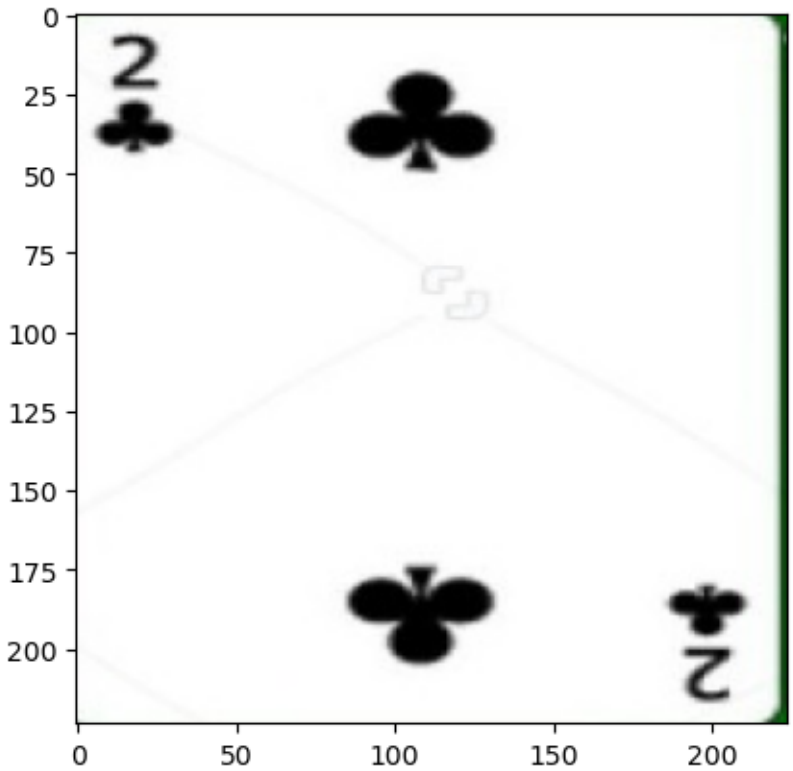
# Get the model's prediction for the image
prediction = model.predict(img_arr)

# Print the predicted class and its probability
class_index = prediction.argmax()
print(f"Class: {class_names[class_index]}")

# Plot Card Image
plt.imshow(img)
```

```
1/1 [==============================] - 0s 43ms/step
Class: two of clubs
```

[94]: <matplotlib.image.AxesImage at 0x720b4210e910>



Analysis According to the results, the Sequential model achieved a very low test accuracy of approximately 2%. However, it correctly predicted the image class. This could be due to the fact that sequential models are typically designed for analyzing sequential data and may not be the most suitable choice for image analysis. Furthermore, a more complex architecture such as a CNN may be necessary to accurately extract features and classify the images in this dataset.

1.0.5 Convolutional Neural Network Model

- rescale image: normalize pixels values & image size is 224 x 224 and channels = 3
- create a convolutional layer with 32 filters, same padding and relu activation
- max pooling
- create another convolutional layer with 64 filters, same padding and relu activation
- max pooling
- create another convolutional layer with 128 filters, same padding and relu activation
- max pooling
- flattens tensor into 1d array
- drop (0.5) to prevent overfitting
- create a dense layer with 128 neurons and relu activation
- create a dense layer with 53 neurons and softmax activation (used for multi-class classification to output probabilities)

[75]:
```
from tensorflow.keras.layers import Conv2D, MaxPooling2D, Dropout, Flatten,␣
 ↪Dense

model2 = tf.keras.Sequential([
    tf.keras.layers.Rescaling(1./255, input_shape=(224, 224, 3)),
    tf.keras.layers.Conv2D(32, 3, padding='same', activation='relu'),
    tf.keras.layers.MaxPooling2D(),
    tf.keras.layers.Conv2D(64, 3, padding='same', activation='relu'),
    tf.keras.layers.MaxPooling2D(),
    tf.keras.layers.Conv2D(128, 3, padding='same', activation='relu'),
    tf.keras.layers.MaxPooling2D(),
    tf.keras.layers.Flatten(),
    tf.keras.layers.Dropout(0.5),
    tf.keras.layers.Dense(128, activation='relu'),
    tf.keras.layers.Dense(num_classes, activation="softmax"),
])
```

Compile/Train Model

[76]:
```
# Compile Model
# Loss: categorical_crossentropy (used for multi-class classification for␣
 ↪labels that must fit in one class)
# Optimizer: adam
# Metrics: Accuracy
```

```
model2.compile(loss='categorical_crossentropy',
               optimizer='adam',
               metrics=['accuracy'])

# Train model
# Train model using the training data, 5 epochs, a batch size of 32, and use␣
 ↪the test data
history = model2.fit(train,
                     epochs=10,
                     batch_size=32,
                     verbose=1,
                     validation_data=test)
```

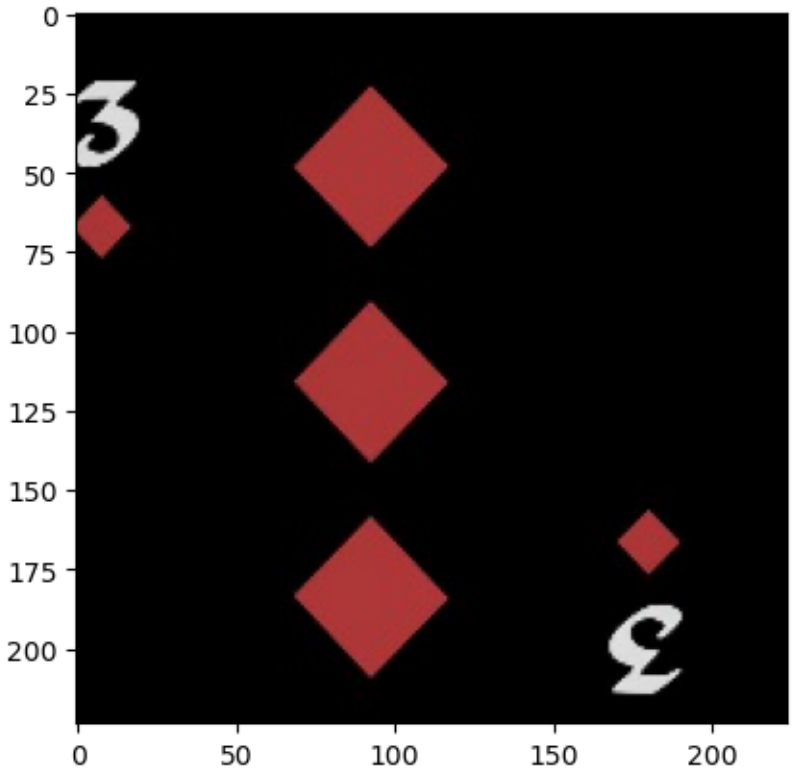
[107]: `<matplotlib.image.AxesImage at 0x720b40b9ce90>`



Analysis Our Convolutional Neural Network (CNN) model has a high accuracy (~78%) and predicted the image correctly due to its ability to learn hierarchical representations, where each layer learns progressively more complex features. Moreover, CNNs reduce the input's dimensionality using convolutional and pooling layers, and control overfitting through methods like dropout.

Additionally, having a large dataset is beneficial to predict better on unseen data.

1.0.6 Pre-Trained Model: MobileNet (V2)

Source: https://www.kaggle.com/code/paultimothymooney/mobilenetv2-with-tensorflow

Steps

- Resize the Data: 128 x 128
- Load the Pre-Trained Model
- Define a Sequential Model
- Provide Build Parameters
- Compile the Model
- Train Model

[46]:
```
import tensorflow_hub as hub

# Resize the Training Data to 128 x 128
train2 = tf.keras.preprocessing.image_dataset_from_directory(
    "/kaggle/input/cards-image-datasetclassification/train",
    labels="inferred",
    label_mode="categorical",
    color_mode="rgb",
    image_size=(128, 128),
    seed=1234,
    batch_size=32,
)

# Resize the Testing Data to 128 x 128
test2 = tf.keras.preprocessing.image_dataset_from_directory(
    "/kaggle/input/cards-image-datasetclassification/test",
    labels="inferred",
    label_mode="categorical",
    color_mode="rgb",
    image_size=(128, 128),
    seed=1234,
    batch_size=32,
)

# Load the Pre-Trained Model (1st layer)
keras_layer = hub.KerasLayer('https://kaggle.com/models/google/mobilenet-v2/
 ↪frameworks/TensorFlow2/variations/035-128-classification/versions/2')

# Define a Sequential Model:
# Neural Network with 53 neurons (2nd layer)
# Softmax Activation: used for multi-class classification to find probabilities␣
 ↪for each class (53 classes)
```

```
model3 = tf.keras.Sequential([
    keras_layer,
    tf.keras.layers.Dense(53, activation='softmax')
])

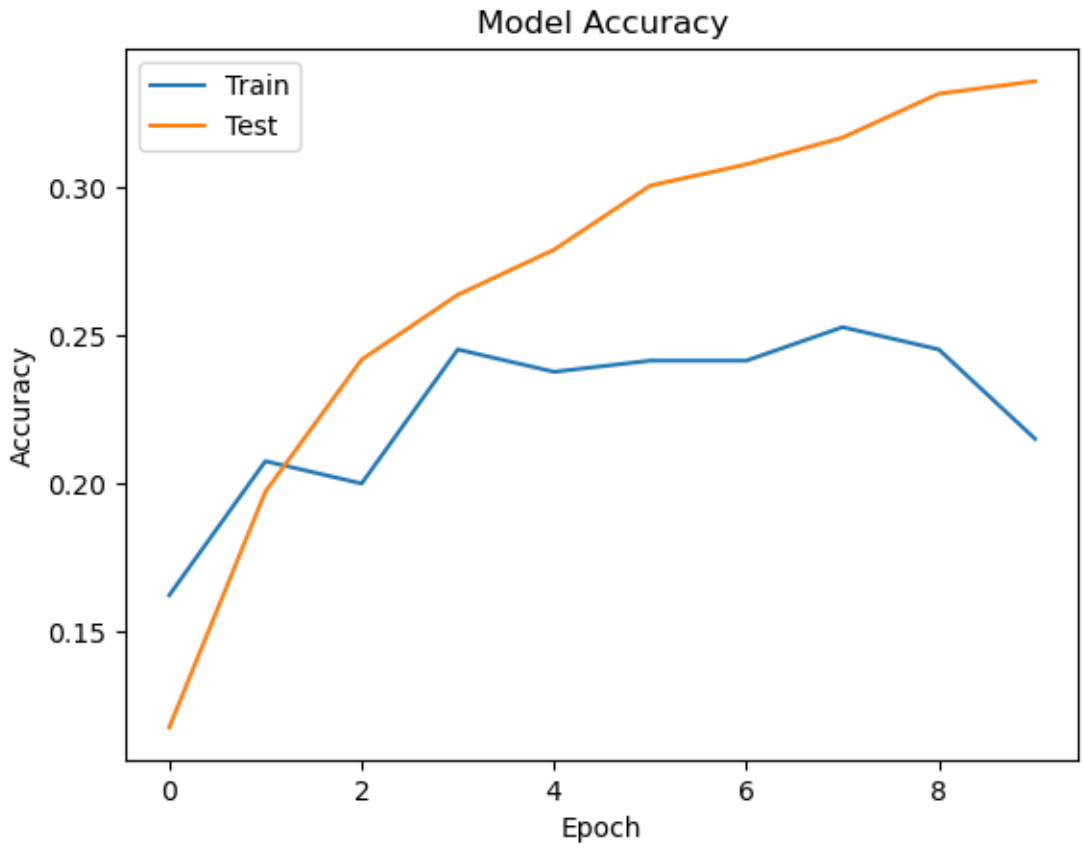
Plot the Model Metrics for each Epoch

[49]:
```
plt.plot(history.history['val_accuracy'])
plt.plot(history.history['accuracy'])
plt.title('Model Accuracy')
plt.ylabel('Accuracy')
plt.xlabel('Epoch')
plt.legend(['Train', 'Test'], loc='upper left')
plt.show()

score = model3.evaluate(test2, verbose=0)
print('Test Loss:', score[0])
print('Test Accuracy:', score[1])
```



```
Test Loss: 2.962161064147949
Test Accuracy: 0.21509434282779694
```

Test using an Image

[95]:
```
# Load and preprocess the image
img_path = '/kaggle/input/cards-image-datasetclassification/train/eight of␣
 ↪clubs/011.jpg'
img = load_img(img_path, target_size=(128, 128))
img_arr = img_to_array(img) / 255.0
img_arr = img_arr.reshape((1, 128, 128, 3))

# Get the model's prediction for the image
prediction = model3.predict(img_arr)

# Print the predicted class and its probability
class_index = prediction.argmax()
print(f"Class: {class_names[class_index]}")

# Plot Card Image
plt.imshow(img)
```

```
1/1 [==============================] - 0s 30ms/step

1.0.7 Fine-Tune the Pre-Trained Model: MobileNet (V2)

Source: https://www.kaggle.com/code/paultimothymooney/mobilenetv2-with-tensorflow

Steps Define a Sequential Model * Provide Build Parameters * Compile the Model * Train Model

[128]:
```
# Define a Sequential Model:
# Rescale
# Neural Network with 128 neurons (2nd layer)
# Dropout to prevent Overfitting
# Neural Network with 53 neurons (3rd layer)
# Softmax Activation: used for multi-class classification to find probabilities␣
 ↪for each class (53 classes)
model4 = tf.keras.Sequential([
    keras_layer,
    tf.keras.layers.Rescaling(1./127.5, offset=-1),
```

```
    tf.keras.layers.Dense(128, activation='softmax'),
    tf.keras.layers.Dropout(0.5),
    tf.keras.layers.Dense(53, activation='softmax')
])

# Build Parameters:
# None: Batch size is not specified
# Shape of the Input: 128 x 128
# Channels: 3
model4.build([None, 128, 128, 3])

# Compile Model
# Loss: categorical_crossentropy (used for multi-class classification for␣
 ↪labels that must fit in one class)
# Optimizer: adam (use learning rate)
# Metrics: Accuracy
base_learning_rate = 0.0001
model4.compile(loss='categorical_crossentropy',
              optimizer=tf.keras.optimizers.
 ↪Adam(learning_rate=base_learning_rate),
              metrics=['accuracy'])

# Train model
# Train model using the training data, 10 epochs, a batch size of 32, and use␣
 ↪the test data
history = model4.fit(train2,
                     epochs=10,
                     batch_size=100,
                     verbose=1,
                     validation_data=test2)
```

```

Analysis As observed, the test accuracy obtained through transfer learning using the MobileNet (V2) model is quite low (~22% & ~2%). Additionally, the model predictions were wrong both times. One possible explanation for this could be that the MobileNet (V2) model was originally trained using the massive ImageNet dataset and may not be able to generalize well on our dataset, which is

much smaller in comparison. Specifically, the ImageNet dataset contains 14,197,122 images, whereas ours only has 7,624 images. Hence, it is likely that the MobileNet (V2) model is too complex to effectively learn from our limited amount of data. It is worth noting that the pre-trained model used in this case is the one from Kaggle, not the original MobileNet V2 model developed by Google. This could also potentially explain the low accuracy observed in the results.

1.1 The CNN Model yields the highest accuracy for our data!
